

### **24 Hour Urine Collection Instructions:**

1. On the day of collection, do not collect the first urine passed after waking up (first morning void). Begin the collection after this time.
2. Collect **all** urine for the next 24 hours. The urine passed shortly after waking up on the second morning is the final urine added to the collection. If you fill one container, continue to collect all urine in a second container (available upon request).
3. Keep the urine refrigerated or on ice.
4. Make sure each container is labeled with the patient's name in indelible ink.
5. Deliver the 24 hour specimen container (all containers if more than one was used) (tightly capped) as soon as possible after completing the collection to: LabCorp
